Why, When, and How: Evidence-Based Strategies for Successful Outcomes.

Dr. Robert Hanna, DDS, a San Dimas native and UCLA graduate, began his career as a high school math and science teacher before earning his dental degree from USC. At USC, he was part of the IV sedation/emergency team and earned multiple honors for academics, research, and leadership. He completed his Oral and Maxillofacial Surgery residency at Albert Einstein College of Medicine/Montefiore in New York, serving as chief resident.

Dr. Hanna now practices at Inland Empire Oral and Maxillofacial Surgery, offering comprehensive care with a focus on full arch reconstruction, bone grafting, and trauma. Fluent in Spanish, he previously worked across Southern California as an itinerant surgeon. In his free time, he enjoys sports, fitness, reading, and spending time with his wife, Natalie, and their dog, Teddy.

Objectives

- Define the clinical indications and contraindications for immediate implant placement.
- Describe the biological and healing principles that influence immediate implant outcomes.
- Assess patient and site-specific factors that impact case selection, including bone volume, tissue phenotype, and presence of infection.
- Outline the surgical steps involved in immediate implant placement, including atraumatic extraction and proper implant positioning.
- Explain the role and timing of provisional restorations in achieving esthetic and functional success.
- Compare the advantages and limitations of immediate versus delayed implant protocols.
- Communicate effectively with the surgical team to support interdisciplinary treatment planning and co-management.
- Identify potential complications associated with immediate implant therapy and describe preventive and corrective strategies.

Summary

Immediate implant therapy is a valuable treatment option that can enhance patient satisfaction by reducing overall treatment time and preserving hard and soft tissue architecture. This lecture will provide a practical overview of immediate implant placement in both anterior and posterior sites, including key case selection criteria, surgical principles, and prosthetic considerations. Emphasis will be placed on interdisciplinary collaboration, risk assessment, and managing patient expectations. Through clinical examples and evidence-based guidelines, participants will gain a clear understanding of when immediate implants are appropriate and how to optimize outcomes through careful planning and technique. This course is designed to improve communication between the surgical and restorative teams and help referring dentists identify ideal cases for referral and co-management.

Target Audience: Dentists, Dental Hygienists, Dental Assistants.
